Description

Apart from the *main* repository we have now, I would like to propose a *testing* repository, too, where we deploy unstable / testing packages. The need was raised in AMARSi, where some of our packages will depend on packages of some partner's *testing* packages/repository. But I even think, this could make sense for our core packages, maybe even all our non-release (trunk) packages. The positive effect would be that users would have to actively decide on using testing packages and would now that they have to be prepared for changes, API breaks, and stuff.

This would probably require slightly adapting our CI upload policies, e. g. to push packages to

- uplaod/main/${ubuntu_release} and
- upload/testing/${ubuntu_release}

(currently just upload/${ubuntu_release})

History

#1 - 02/26/2013 11:32 AM - J. Wienke

Michael and I have talked about this some time ago and basically agreed on this. So it should just be done.

- Status changed from Feedback to New

Very well, then!

@Michael: Could you have a look at this and propose an CI uploading policy, that we then can batch-update on Jenkins with Jan's tools?

- Status changed from New to Resolved

We do this already, I think. Doesn't matter anymore if we don't.
