Description			
<p>Change debian package server deployment to a nightly strategy so that there is more time during development days to fix packages before they end up at end user computers.</p> <p>1. For this purpose, remove the package server upload from the existing debian package jobs</p> <p>2. Add new jobs which get the latest stable debian package from the packaging jobs via copy artifacts and upload them to the server at a nightly basis.</p>
