

vdemo - Bug #2741

text-based remote-control of vdemo gui needs improvement

10/05/2017 03:39 AM - L. Schillingmann

Status:	Resolved	Start date:	10/05/2017
Priority:	Normal	Due date:	
Assignee:	L. Schillingmann	% Done:	100%
Category:		Estimated time:	0.00 hour
Target version:			
Description			
<p>The vdemo with the --fifo option uses a fifo and a text file for the responses.</p> <p>vdemo responds to commands and write the result to the text file.</p> <p>However, this interface does not ensure that a given response originated from the calling script.</p> <p>The socket command provides a way to avoid these issues.</p>

It would be great, if you could propose a pull request.

#2 - 10/23/2017 02:08 AM - L. Schillingmann

- Status changed from New to Resolved

- % Done changed from 0 to 100

- vdemo can now be run from python3's tkinter context. I integrated text based remote control based on pythons HTTPServer.
- Further work such as html / authentication / https features are now easy to implement.
- The python3 integration is still optional at the moment.
- In the long run it will be possible to move the tcl codebase slowly to python.
